

CLAIMS LISTING

1. (currently amended) A method for optimizing a wireless electromagnetic communications network, comprising:

- a wireless electromagnetic communications network, comprising
 - a set of nodes, said set of nodes further comprising,
 - at least a first subset wherein each node is MIMO-capable, comprising:
 - an antennae array of M $[M]$ antennae, where M $[M] \geq$ one,
 - a transceiver for each antenna in said spatially diverse antennae array,
 - means for digital signal processing to convert analog radio signals into digital signals and digital signals into analog radio signals,
 - means for coding and decoding data, symbols, and control information into and from digital signals,
 - diversity capability means for transmission and reception of said analog radio waves[signals],
 - and,
 - means for input and output from and to a non-radio interface for digital signals;
 - said set of nodes being deployed according to design rules that prefer meeting the following criteria:
 - said set of nodes further comprising two or more proper subsets of nodes, with a first proper subset being the transmit uplink / receive downlink set, and a second proper subset being the transmit downlink / receive uplink set;
 - each node in said set of nodes belonging to no more transmitting uplink or receiving uplink subsets than it has diversity capability means;

each node in a transmit uplink / receive downlink subset has no more nodes with which it will hold time and frequency coincident communications in its field of view, than it has diversity capability [means];

each node in a transmit downlink / receive uplink subset has no more nodes with which it will hold time and frequency coincident communications in its field of view, than it has diversity capability [means];

each member of a transmit uplink / receive downlink subset cannot hold time and frequency coincident communications with any other member of that transmit uplink / receive downlink subset;

and,

each member of a transmit downlink / receive uplink subset cannot hold time and frequency coincident communications with any other member of that transmit downlink / receive uplink subset;

transmitting, in said wireless electromagnetic communications network, independent information from each node belonging to a first proper subset, to one or more receiving nodes belonging to a second proper subset that are viewable from the transmitting node;

processing independently, in said wireless electromagnetic communications network, at each receiving node belonging to said second proper subset, information transmitted from one or more nodes belonging to said first proper subset;

and,

dynamically adapting the diversity channels[capability means] and said proper subsets to optimize said network.

2. (currently amended) A method for optimizing a wireless electromagnetic communications network, comprising:

a wireless electromagnetic communications network, comprising

a set of nodes, said set of nodes further comprising,
 at least a first subset wherein each node is MIMO-capable,
 comprising:
 a spatially diverse antennae array of M [M] antennae,
 where M [M] \geq two,
 a transceiver for each antenna in said spatially diverse
 antennae array,
 means for digital signal processing to convert analog radio
 signals into digital signals and digital signals into analog
 radio signals,
 means for coding and decoding data, symbols, and control
 information into and from digital signals,
 diversity capability means for transmission and reception of
 said analog radio waves[signals],
 and,
 means for input and output from and to a non-radio
 interface for digital signals;
 said set of nodes being deployed according to design rules that prefer
 meeting the following criteria:
 said set of nodes further comprising two or more proper subsets of
 nodes, with a first proper subset being the transmit uplink / receive
 downlink set, and a second proper subset being the transmit
 downlink / receive uplink set;
 each node in said set of nodes belonging to no more transmitting
 uplink or receiving uplink subsets than it has diversity capability
 means;
 each node in a transmit uplink / receive downlink subset has no
 more nodes with which it will hold time and frequency coincident
 communications in its field of view, than it has diversity capability
 [means];

each node in a transmit downlink / receive uplink subset has no more nodes with which it will hold time and frequency coincident communications in its field of view, than it has diversity capability [means];

each member of a transmit uplink / receive downlink subset cannot hold time and frequency coincident communications with any other member of that transmit uplink / receive downlink subset;

and,

each member of a transmit downlink / receive uplink subset cannot hold time and frequency coincident communications with any other member of that transmit downlink / receive uplink subset;

transmitting, in said wireless electromagnetic communications network, independent information from each node belonging to a first proper subset, to one or more receiving nodes belonging to a second proper subset that are viewable from the transmitting node;

processing independently, in said wireless electromagnetic communications network, at each receiving node belonging to said second proper subset, information transmitted from one or more nodes belonging to said first proper subset;

and,

dynamically adapting the diversity channels [capability means] and said proper subsets to optimize said network.

3. (currently amended) A method as in claim 1, wherein dynamically adapting the diversity channels [capability means] and said proper subsets to optimize said network further comprises:

using substantive null steering to minimize SINR between nodes transmitting and receiving information.

123 4. (currently amended) A method as in claim 1, wherein dynamically adapting the
124 diversity ~~channels~~ [capability means] and said proper subsets to optimize said network
125 further comprises:
126 using max-SINR null- and beam-steering to minimize intra-network interference.
127
128
129 5. (currently amended) A method as in claim 1, wherein dynamically adapting the
130 diversity ~~channels~~ [capability means] and said proper subsets to optimize said network
131 further comprises:
132 using MMSE null- and beam-steering to minimize intra-network interference.
133
134
135 6. (currently amended) A method as in claim 1, wherein dynamically adapting the
136 diversity ~~channels~~ [capability means] and said proper subsets to optimize said network
137 further comprises:
138
139 designing the network such that reciprocal symmetry exists for each pairing of
140 uplink receive and downlink receive proper subsets.
141
142 7. (currently amended) A method as in claim 1, wherein dynamically adapting the
143 diversity ~~channels~~ [capability means] and said proper subsets to optimize said network
144 further comprises:
145
146 designing the network such that substantial reciprocal symmetry exists for each
147 pairing of uplink receive and downlink receive proper subsets.
148
149 8. (original) A method as in claim 1, wherein the network uses TDD communication
150 protocols.
151
152 9. (original) A method as in claim 1, wherein the network uses FDD communication
153 protocols.

154

155 10. (original) A method as in claim 3, wherein the network uses simplex communication
156 protocols.

157

158 11. (original) A method as in claim 1, wherein the network uses random access packets,
159 and receive and transmit operations are all carried out on the same frequency channels for
160 each link.

161

162 12. (currently amended) A method as in claim 1, wherein dynamically adapting the
163 diversity channels [capability means] and said proper subsets to optimize said network
164 further comprises

165

166 if the received interference is spatially white in both link directions, setting

167 $\mathbf{g}_1(\mathbf{a}q) \propto \mathbf{w}_2^*(q) \text{ and } \mathbf{g}_2(q) \propto \mathbf{w}_1^*(q)$

168 [$\mathbf{g}_2(q) \propto \mathbf{w}_2^*(q) \text{ and } \mathbf{g}_1(q) \propto \mathbf{w}_1^*(q)$] at both ends of the link,

169 where $\{\mathbf{g}_2(q), \mathbf{w}_1(q)\}$

170 [$\{\mathbf{g}_2(q), \mathbf{w}_1(q)\}$] are the linear transmit and receive weights used in the
171 downlink;

172

173 but if the received interference is not spatially white in both link directions,

174 constraining $\{\mathbf{g}_1(q)\}$ and $\{\mathbf{g}_2(q)\}$ $\{\mathbf{g}_1(q)\}$ and [$\{\mathbf{g}_2(q)\}$] to
175 preferentially satisfy:

176

177
$$\sum_{q=1}^{N_t} \mathbf{g}_1^T(q) \mathbf{R}_{i+1,i}[\mathbf{n}_1(q)] \mathbf{g}_2^*(q) = \sum_{n=1}^{N_t} \text{Tr}\{\mathbf{R}_{i+1,i}(n)\} = \mathbf{M}_1 \mathbf{R}_1$$

178

179 $q=1 \text{ } n=1$

180

$$\sum_{q=1}^{Q_{12}} \mathbf{g}_2^T(q) \mathbf{R}_{i_2 i_2} [n_2(q)] \mathbf{g}_2^*(q) = \sum_{n=1}^{N_2} \text{Tr}\{\mathbf{R}_{i_2 i_2}(n)\} = M_2 R_2.$$

[

$$\sum_{q=1}^{Q_{21}} \mathbf{g}_1^T(q) \mathbf{R}_{i_1 i_1} (n_1(q)) \mathbf{g}_1^*(q) = \sum_{n=1}^{N_1} \text{Tr}\{\mathbf{R}_{i_1 i_1}(n)\} = M_1 R_1$$

$$\sum_{q=1}^{Q_{12}} \mathbf{g}_2^T(q) \mathbf{R}_{i_2 i_2} (n_2(q)) \mathbf{g}_2^*(q) = \sum_{n=1}^{N_2} \text{Tr}\{\mathbf{R}_{i_2 i_2}(n)\} = M_2 R_2 \quad].$$

13. (currently amended) A method as in claim 1, wherein:

a proper subset may incorporate one or more nodes that are in a receive-only mode for every diversity channel [capability means].

14. (original) A method as in claim 1, wherein:

the network may dynamically reassign a node from one proper subset to another.

15. (original) A method as in claim 1, wherein:

the network may dynamically reassign a proper subset of nodes from one proper subset to another.

16. (currently amended) A method as in claim 7, wherein the step of designing the network such that substantial reciprocal symmetry exists for the uplink and downlink channels further comprises:

if the received interference is spatially white in both link directions, setting

$$\mathbf{g}_1(q) \propto \mathbf{w}_2^*(q) \text{ and } \mathbf{g}_2(q) \propto \mathbf{w}_1^*(q)$$

$$[\mathbf{g}_2(q) \propto \mathbf{w}_2^*(q) \text{ and } \mathbf{g}_1(q) \propto \mathbf{w}_1^*(q)] \text{ at both ends of the link,}$$

where $\{\mathbf{g}_2(q), \mathbf{w}_1(q)\}$ [$\{\mathbf{g}_2(q), \mathbf{w}_1(q)\}$] are the linear transmit and receive weights used in the downlink;

but if the received interference is not spatially white in both link directions, constraining $\{\mathbf{g}_1(q)\}$ and $\{\mathbf{g}_2(q)\}$ [$\{\mathbf{g}_1(q)\}$ and $\{\mathbf{g}_2(q)\}$] to preferentially satisfy:

$$\sum_{q=1}^{Q_{21}} \mathbf{g}_1^T(q) \mathbf{R}_{i_1 i_1} [n_1(q)] \mathbf{g}_1^*(q) = \sum_{n=1}^{N_1} \text{Tr}\{\mathbf{R}_{i_1 i_1}(n)\} = M_1 R_1$$

$$\sum_{q=1}^{Q_{12}} \mathbf{g}_2^T(q) \mathbf{R}_{i_2 i_2} [n_2(q)] \mathbf{g}_2^*(q) = \sum_{n=1}^{N_2} \text{Tr}\{\mathbf{R}_{i_2 i_2}(n)\} = M_2 R_2$$

[

$$\sum_{q=1}^{Q_{21}} \mathbf{g}_1^T(q) \mathbf{R}_{i_1 i_1} (n_1(q)) \mathbf{g}_1^*(q) = \sum_{n=1}^{N_1} \text{Tr}\{\mathbf{R}_{i_1 i_1}(n)\} = M_1 R_1$$

$$\sum_{q=1}^{Q_{12}} \mathbf{g}_2^T(q) \mathbf{R}_{i_2 i_2}(n_2(q)) \mathbf{g}_2^*(q) = \sum_{n=1}^{N_2} \text{Tr}\{\mathbf{R}_{i_2 i_2}(n)\} = M_2 R_2 \quad] .$$

230

231

232 17. (original) A method as in claim 1, wherein the means for digital signal processing in
233 said first subset of MIMO-capable nodes further comprises:

234

235 an ADC bank for downconversion of received RF signals into digital signals;

236 a MT DEMOD element for multitone demodulation, separating the received

237 signal into distinct tones and splitting them into 1 through $K[K]_{\text{feed}}$ FDMA

238 channels, said separated tones in aggregate forming the entire baseband for the

239 transmission, said MT DEMOD element further comprising

240 a Comb element with a multiple of 2 filter capable of operating on a 128-

241 bit sample; and,

242 an FFT element with a 1,024 real-IF function;

243 a Mapping element for mapping the demodulated multitone signals into a 426

244 active receive bins, wherein

245 each bin covers a bandwidth of 5.75MHz;

246 each bin has an inner passband of 4.26MHz for a content envelope;

247 each bin has an external buffer, up and down, of 745kHz;

248 each bin has 13 channels, CH0 through CH12, each channel having 320

249 kHz and 32 tones, T0 through T31, each tone being 10kHz, with the inner

250 30 tones being used information bearing and T0 and T31 being reserved;

251 each signal being 100μs, with 12.5μs at each end thereof at the front and

252 rear end thereof forming respectively a cyclic prefix and cyclic suffix

253 buffer to punctuate successive signals;

254 and,

255 a symbol-decoding element for interpretation of the symbols embedded in the

256 signal.

257

18. (currently amended) A method as in claim 1, wherein dynamically adapting the diversity channels [capability means] and said proper subsets to optimize said network further comprises

using at each node the receive combiner weights as transmit distribution weights during subsequent transmission operations, so that the network is preferentially designed and constrained such that each link is substantially reciprocal, such that the ad hoc network capacity measure can be made equal in both link directions by setting at both ends of the link:

$$\cancel{g_2(q)} \propto \cancel{w_2^*(k,q)} \text{ and } \cancel{g_1(k,q)} \propto \cancel{w_1^*(k,q)}$$

$$[g_2(k,q) \propto w_2^*(k,q) \text{ and } g_1(k,q) \propto w_1^*(k,q)],$$

where $\{\cancel{g_2(k,q)}, \cancel{w_1(k,q)}\}$ [$\{g_2(k,q), w_1(k,q)\}$] are the linear transmit and receive weights to transmit data $d_2(k,q)$ from node $n_2(q)$ to node $n_1(q)$ over channel k in the downlink, and where $\{g_1(k,q), w_2(k,q)\}$ are the linear transmit and receive weights used to transmit data $d_1(k,q)$ from node $n_1(q)$ back to node $n_2(q)$ over equivalent channel k in the uplink.

19. (currently amended) A method as in claim 1, wherein the step of each node in a transmit downlink / receive uplink subset having no more nodes with which it will hold

time and frequency coincident communications in its field of view, than it has diversity capability [means] further comprises:

designing the topological, physical layout of nodes to enforce this constraint within the node's diversity channel means limitations.

20. (currently amended) A method as in claim 1, wherein the step of each node in a transmit uplink / receive downlink subset having no more nodes with which it will hold time and frequency coincident communications in its field of view, than it has diversity capability [means] further comprises:

designing the topological, physical layout of nodes to enforce this constraint within the node's diversity channel means limitations.

21. (currently amended) A method as in claim 1, wherein the step of dynamically adapting the diversity ~~channels~~ [capability means] and said proper subsets to optimize said network further comprises:

allowing a proper subset to send redundant data transmissions over multiple frequency channels to another proper subset.

22. (original) A method as in claim 1, wherein the step of dynamically adapting the diversity ~~channels~~ [capability means] and said proper subsets to optimize said network further comprises:

allowing a proper subset to send redundant data transmissions over multiple simultaneous or differential time slots to another proper subset.

313 23. (original) A method as in claim 1, wherein said transmitting proper subset and
314 receiving proper subset diversity capability means for transmission and reception of said
315 analog radio waves [signals] further comprise:
316 spatial diversity of antennae.

317

318

319 24. (original) A method as in claim 1, wherein said transmitting proper subset and
320 receiving proper subset diversity capability means for transmission and reception of said
321 analog radio waves [signals] further comprise:
322 polarization diversity of antennae.

323

324

325 25. (original) A method as in claim 1, wherein said transmitting proper subset and
326 receiving proper subset diversity capability means for transmission and reception of said
327 analog radio waves [signals] further comprise:
328 any combination of temporal, spatial, and polarization diversity of antennae.

329

330

331 26. (currently amended) A method as in claim 1, wherein the step of dynamically
332 adapting the diversity channels [capability means] and said proper subsets to optimize
333 said network further comprises:

334 incorporating network control and feedback aspects as part of the signal encoding
335 process.

336

337

338 27. (currently amended) A method as in claim 1, wherein the step of dynamically
339 adapting the diversity channels [capability means] and said proper subsets to optimize
340 said network further comprises:

341 incorporating network control and feedback aspects as part of the signal encoding
342 process and including said as network information in one direction of the
343 signalling and optimization process, using the perceived environmental

condition's effect upon the signals in the other direction of the signalling and optimization process.

28. (currently amended) A method as in claim 1, wherein the step of dynamically adapting the diversity ~~channels~~ [capability means] and said proper subsets to optimize said network further comprises:

adjusting the diversity ~~channel~~ [capability means] use between any proper sets of nodes by rerouting any active link based on perceived unacceptable SINR experienced on that active link and the existence of an alternative available link using said adjusted diversity ~~channel~~ [capability means].

29. (currently amended) A method as in claim 1, wherein the step of dynamically adapting the diversity ~~channels~~ [capability means] and said proper subsets to optimize said network further comprises:

switching a particular node from one proper subset to another due to changes in the external environment affecting links between that node and other nodes in the network.

30. (currently amended) A method as in claim 1, wherein the step of dynamically adapting the diversity ~~channels~~ [capability means] and said proper subsets to optimize said network further comprises:

dynamically reshuffling proper subsets to more closely attain network objectives by taking advantage of diversity channel availability.

31. (currently amended) A method as in claim 1, wherein the step of dynamically adapting the diversity ~~channels~~ [capability means] and said proper subsets to optimize said network further comprises:

375 dynamically reshuffling proper subsets to more closely attain network objectives
376 by accounting for node changes.

377
378
379 32. (currently amended) A method as in claim 31, wherein said node changes
380 include any of:

381 adding diversity capability [means] to a node, adding a new node within the field
382 of view of another node, removing a node from the network (temporarily or
383 permanently), or losing diversity capability [means] at a node.

384
385
386 33. (currently amended) A method as in claim 1, wherein the step of dynamically
387 adapting the diversity ~~channels~~ [capability means] and said proper subsets to optimize
388 said network further comprises:

389 suppressing unintended recipients or transmitters by the imposition of signal
390 masking.

391
392
393 34. (original) A method as in claim 33, wherein the step of suppressing unintended
394 recipients or transmitters by the imposition of signal masking further comprises:
395 imposition of an origination mask.

396
397
398 34. (original) A method as in claim 33, wherein the step of suppressing unintended
399 recipients or transmitters by the imposition of signal masking further comprises:
400 imposition of a recipient mask.

401
402
403 35. (original) A method as in claim 33, wherein the step of suppressing unintended
404 recipients or transmitters by the imposition of signal masking further comprises:
405 imposition of any combination of origination and recipient masks.

406

407

408 36. (currently amended) A method as in claim 33, wherein the step of dynamically
409 adapting the diversity channels [capability means] and said proper subsets to optimize
410 said network further comprises:

411 using signal masking to secure transmissions against unintentional, interim
412 interception and decryption by the imposition of a signal mask at origination, the
413 transmission through any number of intermediate nodes lacking said signal mask,
414 and the reception at the desired recipient which possesses the correct means for
415 removal of the signal mask.

416

417

418 37. (original) A method as in claim 36, wherein the signal masking is shared by a proper
419 subset.

420

421

422 38. (currently amended) A method as in claim 1, wherein the step of dynamically
423 adapting the diversity channels [capability means] and said proper subsets to optimize
424 said network further comprises:

425 heterogenous combination of a hierarchy of proper subsets, one within the other,
426 each paired with a separable subset wherein the first is a transmit uplink and the
427 second is a transmit downlink subset, such that the first subset of each pair of
428 subsets is capable of communication with the members of the second subset of
429 each pair, yet neither subset may communicate between its own members.

430

431

432 39. (original) A method as in claim 1, wherein the step of dynamically adapting the
433 diversity channels [capability means] and said proper subsets to optimize said network
434 further comprises:

using as many of the available diversity ~~channels~~ [capability means] as are needed for traffic between any two nodes from 1 to NumChannels, where NumChannels equals the maximal diversity capability [means] between said two nodes.

40. (original) A method as in claim 1, wherein the step of dynamically adapting the diversity ~~channels~~ [capability means] and said proper subsets to optimize said network further comprises:

~~using~~ [using] a water-filling algorithm to route traffic between an origination and destination node through any intermediate subset of nodes that has available diversity ~~channel~~ [capability means] capacity.

41. (currently amended) A method for optimizing a wireless electromagnetic communications network, comprising:

a wireless electromagnetic communications network, comprising

a set of nodes, said set further comprising,

at least a first subset of MIMO-capable nodes, each MIMO-capable node comprising:

a spatially diverse antennae array of $M[M]$ antennae, where $M[M] \geq$ two, said antennae array being polarization diverse, and circularly symmetric, and providing 1-to-M RF feeds;

a transceiver for each antenna in said array, said transceiver further comprising

a Butler Mode Forming element, providing spatial signature separation with a FFT-LS algorithm, reciprocally forming a transmission with shared receiver feeds, such that the number of modes out equals the numbers of antennae, establishing such as an ordered set with decreasing energy, further comprising:

466 a dual-polarization element for splitting the
 467 modes into positive and negative polarities
 468 with opposite and orthogonal polarizations,
 469 that can work with circular polarizations,
 470 and
 471 a dual-polarized link CODEC;
 472 a transmission/reception switch comprising,
 473 a vector OFDM receiver element;
 474 a vector OFDM transmitter element;
 475 a LNA bank for a receive signal, said LNA
 476 Bank also instantiating low noise
 477 characteristics for a transmit signal;
 478 a PA bank for the transmit signal that
 479 receives the low noise characteristics for
 480 said transmit signal from said LNA bank;
 481 an AGC for said LNA bank and PA bank;
 482 a controller element for said
 483 transmission/reception switch enabling
 484 baseband link distribution of the energy over
 485 the multiple RF feeds on each channel to
 486 steer up to $K[K]_{\text{feed}}$ beams and nulls
 487 independently on each FDMA channel;
 488 a Frequency Translator;
 489 a timing synchronization element controlling
 490 said controller element;
 491 further comprising a system clock,
 492 a universal Time signal element;
 493 GPS;
 494 a multimode power management element
 495 and algorithm;
 496 and,

a LOs element;
 said vector OFDM receiver element comprising
 an ADC bank for downconversion of
 received RF signals into digital signals;
 a MT DEMOD element for multitone
 demodulation, separating the received signal
 into distinct tones and splitting them into 1
 through $K[K]_{\text{feed}}$ FDMA channels, said
 separated tones in aggregate forming the
 entire baseband for the transmission, said
 MT DEMOD element further comprising
 a Comb element with a multiple of 2
 filter capable of operating on a 128-
 bit sample; and,
 an FFT element with a 1,024 real-IF
 function;
 a Mapping element for mapping the
 demodulated multitone signals into a 426
 active receive bins, wherein
 each bin covers a bandwidth of
~~5.75MHz~~ [5.75 MHz];
 each bin has an inner passband of
~~4.26MHz~~ [4.26 MHz] for a content
 envelope;
 each bin has an external buffer, up
 and down, of ~~745kHz~~ [745 kHz];
 each bin has 13 channels, CH0
 through CH12, each channel having
 320 kHz and 32 tones, T0 through
 T31, each tone being ~~10kHz~~ [10
 kHz], with the inner 30 tones being

528 used information bearing and T0 and
 529 T31 being reserved;
 530 each signal being ~~100~~ μs [100 μs],
 531 with ~~12.5~~ μs [12.5 μs] at each end
 532 thereof at the front and rear end
 533 thereof forming respectively a cyclic
 534 prefix and cyclic suffix buffer to
 535 punctuate successive signals;
 536 a MUX element for timing modification
 537 capable of element-wise multiplication
 538 across the signal, which halves the number
 539 of bins and tones but repeats the signal for
 540 high-quality needs;
 541 a link CODEC, which separates each FDMA
 542 channel into 1 through M [M] links, further
 543 comprising
 544 a SOVA bit recovery element;
 545 an error coding element;
 546 an error detection element;
 547 an ITI remove element;
 548 a tone equalization element;
 549 and,
 550 a package fragment retransmission
 551 element;
 552 a multilink diversity combining element,
 553 using a multilink Rx weight adaptation
 554 algorithm for Rx signal weights ~~$W(k)$~~
 555 [$W(k)$] to adapt transmission gains
 556 ~~$G(k)$~~ [$G(k)$] for each channel ~~k~~ [k];

557 an equalization algorithm, taking the signal
 558 from said multilink diversity combining
 559 element and controlling a delay removal
 560 element;
 561 said delay removal element separating signal
 562 content from imposed pseudodelay and
 563 experienced environmental signal delay, and
 564 passing the content-bearing signal to a
 565 symbol-decoding element;
 566 said symbol-decoding element for
 567 interpretation of the symbols embedded in
 568 the signal, further comprising:
 569 an element for delay gating;
 570 a QAM element; and
 571 a PSK element;
 572 said vector OFDM transmitter element comprising:
 573 a DAC bank for conversion of digital signals
 574 into RF signals for transmission;
 575 a MT MOD element for multitone
 576 modulation, combining and joining the
 577 signal to be transmitted from 1 through
 578 $K[K]_{\text{feed}}$ FDMA channels, said separated
 579 tones in aggregate forming the entire
 580 baseband for the transmission, said MT
 581 MOD element further comprising
 582 a Comb element with a multiple of 2
 583 filter capable of operating on a 128-
 584 bit sample; and,
 585 an IFFT element with a 1,024 real-IF
 586 function;

587 a Mapping element for mapping the
 588 modulated multitone signals from 426
 589 active transmit bins, wherein
 590 each bin covers a bandwidth of
 591 ~~5.75MHz~~ [5.75 MHz];
 592 each bin has an inner passband of
 593 ~~4.26MHz~~ [4.26 MHz] for a content
 594 envelope;
 595 each bin has an external buffer, up
 596 and down, of ~~745kHz~~ [745 kHz];
 597 each bin has 13 channels, CH0
 598 through CH12, each channel having
 599 320 kHz and 32 tones, T0 through
 600 T31, each tone being ~~10kHz~~ [10
 601 kHz], with the inner 30 tones being
 602 used information bearing and T0 and
 603 T31 being reserved;
 604 each signal being ~~100μs~~ [100 μs],
 605 with ~~12.5μs~~ [12.5 μs] at each end
 606 thereof at the front and rear end
 607 thereof forming respectively a cyclic
 608 prefix and cyclic suffix buffer to
 609 punctuate successive signals;
 610 a MUX element for timing modification
 611 capable of element-wise multiplication
 612 across the signal, which halves the number
 613 of bins and tones but repeats the signal for
 614 high-quality needs;
 615 a symbol-coding element for embedding the
 616 symbols to be interpreted by the receiver in
 617 the signal, further comprising:

618 an element for delay gating;
 619 a QAM element; and
 620 a PSK element;
 621 a link CODEC, which aggregates each
 622 FDMA channel from 1 through M [M] links,
 623 further comprising
 624 a SOVA bit recovery element;
 625 an error coding element;
 626 an error detection element;
 627 an ITI remove element;
 628 a tone equalization element;
 629 and,
 630 a package fragment retransmission
 631 element;
 632 a multilink diversity distribution element,
 633 using a multilink Tx weight adaptation
 634 algorithm for Tx signal weights to adapt
 635 transmission gains $G(k)$ [$G(k)$] for
 636 each channel k [k], such that $g(q;k)$
 637 $\propto w^*(q;k)$ [$g(q;k) \propto w^*(q;k)$];
 638 a TCM codec;
 639 a pilot symbol CODEC element that integrates with said
 640 FFT-LS algorithm a link separation, a pilot and data signal
 641 elements sorting, a link detection, multilink combination,
 642 and equalizer weight calculation operations;
 643 means for diversity transmission and reception,
 644 and,
 645 means for input and output from and to a non-radio
 646 interface;
 647

said set of nodes being deployed according to design rules that prefer meeting the following criteria:

said set of nodes further comprising two or more proper subsets of nodes, with a first proper subset being the transmit uplink / receive downlink set, and a second proper subset being the transmit downlink / receive uplink set;

each node in said set of nodes belonging to no more transmitting uplink or receiving uplink subsets than it has diversity capability means;

each node in a transmit uplink / receive downlink subset has no more nodes with which it will hold time and frequency coincident communications in its field of view, than it has diversity capability [means];

each node in a transmit downlink / receive uplink subset has no more nodes with which it will hold time and frequency coincident communications in its field of view, than it has diversity capability [means];

each member of a transmit uplink / receive downlink subset cannot hold time and frequency coincident communications with any other member of that transmit uplink / receive downlink subset;

and,

each member of a transmit downlink / receive uplink subset cannot hold time and frequency coincident communications with any other member of that transmit downlink / receive uplink subset;

transmitting, in said wireless electromagnetic communications network,
independent information from each node belonging to a first proper subset, to one
or more receiving nodes belonging to a second proper subset that are viewable
from the transmitting node;

processing independently, in said wireless electromagnetic communications
network, at each receiving node belonging to said second proper subset,
information transmitted from one or more nodes belonging to said first proper
subset;

and,

designing the network such that substantially reciprocal symmetry exists for the
uplink and downlink channels by,

if the received interference is spatially white in both link directions, setting

$$\mathbf{g}_1(q) \propto \mathbf{w}_2^*(q) \text{ and } \mathbf{g}_2(q) \propto \mathbf{w}_1^*(q)$$

$$[\mathbf{g}_2(q) \propto \mathbf{w}_2^*(q) \text{ and } \mathbf{g}_1(q) \propto \mathbf{w}_1^*(q)] \text{ at both ends of the}$$

link, where $\{\mathbf{g}_2(q), \mathbf{w}_1(q)\}$ [$\{\mathbf{g}_2(q), \mathbf{w}_1(q)\}$] are the linear
transmit and receive weights used in the downlink;

but if the received interference is not spatially white in both link

directions, constraining $\{\mathbf{g}_1(q)\}$ and $\{\mathbf{g}_2(q)\}$

[$\{\mathbf{g}_1(q)\}$ and $\{\mathbf{g}_2(q)\}$] to satisfy:

$$\mathbf{Q}_{2+}$$

$$\sum \mathbf{g}_1^T(q) \mathbf{R}_{11+} [\mathbf{n}_1(q)] \mathbf{g}_1^*(q) =$$

$$\begin{aligned}
& q=1 \\
& \text{---} N_1 \\
& \text{---} \sum_{n=1} \text{Tr}\{\mathbf{R}_{i_1 i_1}(n)\} = M_1 R_1
\end{aligned}$$

$$\begin{aligned}
& Q_{i_2} \\
& \sum_{q=1} \mathbf{g}_{i_2}^T(q) \mathbf{R}_{i_2 i_2} [n_2(q)] \mathbf{g}_{i_2}^*(q) =
\end{aligned}$$

$$\begin{aligned}
& q=1 \\
& \text{---} n=1 \\
& \text{---} \sum \text{Tr}\{\mathbf{R}_{i_2 i_2}(n)\} = M_2 R_2, \\
& \text{---} N_2
\end{aligned}$$

$$\begin{aligned}
& [\\
& \sum_{q=1}^{Q_{21}} \mathbf{g}_1^T(q) \mathbf{R}_{i_1 i_1} (n_1(q)) \mathbf{g}_1^*(q) = \sum_{n=1}^{N_1} \text{Tr}\{\mathbf{R}_{i_1 i_1}(n)\} = M_1 R_1 \\
& \sum_{q=1}^{Q_{12}} \mathbf{g}_2^T(q) \mathbf{R}_{i_2 i_2} (n_2(q)) \mathbf{g}_2^*(q) = \sum_{n=1}^{N_2} \text{Tr}\{\mathbf{R}_{i_2 i_2}(n)\} = M_2 R_2;]
\end{aligned}$$

using any standard communications protocol, including TDD, FDD, simplex,
 and,
 optimizing the network by dynamically adapting the diversity channels [capability means] between nodes of said transmitting and receiving subsets.

730

731

732 42. (original) A method as in claim 41, wherein said a transmission/reception switch
733 further comprises:

734

735 an element for tone and slot interleaving.

736

737 43. (original) A method as in claim 41, wherein said TMC codec and SOVA decoder are
738 replaced with a Turbo codec.

739

740 44. (currently amended) A method as in claim 1, wherein the step of
741 dynamically adapting the diversity channels [capability means] and said proper subsets to
742 optimize said network further comprises:

743 optimizing at each node acting as a receiver the receive weights using the [a]
744 MMSE technique to adjust the multitone transmissions between it and other
745 nodes.

746

747

748 45. (currently amended) A method as in claim 1, wherein the step of dynamically
749 adapting the diversity channels [capability means] and said proper subsets to optimize
750 said network further comprises:

751 optimizing at each node acting as a receiver the receive weights using the MAX
752 [maximum] SINR to adjust the multitone transmissions between it and other
753 nodes.

754

755

756 46. (currently amended) A method as in claim 1, wherein the step of dynamically
757 adapting the diversity channels [capability means] and said proper subsets to optimize
758 said network further comprises:

759 optimizing at each node acting as a receiver the receive weights, then optimizing
760 the transmit weights at that node by making them proportional to the receive

weights, and then optimizing the transmit gains for that node by a max-min criterion for the link capacities for that node at that particular time.

47. (currently amended) A method as in claim 1, wherein the step of dynamically adapting the diversity channels [capability means] and said proper subsets to optimize said network further comprises:

including, as part of said network, one or more network controller elements that assist in tuning local node's maximum capacity [capacity] criteria and link channel diversity usage to network constraints.

48. (currently amended) A method as in claim 1, wherein the step of dynamically adapting the diversity channels [capability means] and said proper subsets to optimize said network further comprises:

characterizing the channel response vector $\mathbf{a}_1(f, t; n_2, n_1)$ by the observed (possibly time-varying) azimuth and elevation $\{\theta_1(t; n_2, n_1), \varphi_1(f, t; n_2, n_1)\}$ of node n_2 observed at n_1 .

49. (currently amended) A method as in claim 1, wherein the step of dynamically adapting the diversity channels [capability means] and said proper subsets to optimize said network further comprises:

characterizing the channel response vector $\mathbf{a}_1(f, t; n_2, n_1)$ as a superposition of direct-path and near-field reflection path channel responses, e.g., due to scatterers in the vicinity of n_1 , such that each element of $\mathbf{a}_1(f, t; n_2, n_1)$ can be modeled as a random process, possibly varying over time and frequency.

788 50. (currently amended) A method as in claim 1, wherein the step of dynamically
 789 adapting the diversity channels [capability means] and said proper subsets to optimize
 790 said network further comprises:

791 presuming that $\mathbf{a}_1(f, t; n_2, n_1)$ and $\mathbf{a}_1(f, t; n_{2[1]}, n_{4[2]})$ can be
 792 substantively time invariant over significant time durations, e.g., large numbers of
 793 OFDM symbols or TDMA time frames, and inducing the most significant
 794 frequency and time variation by the observed timing and carrier offset on each
 795 link.

796
 797
 798 51. (currently amended) A method as in claim 1, wherein the step of dynamically
 799 adapting the diversity channels [capability means] and said proper subsets to optimize
 800 said network further comprises:

801 in such networks, e.g., TDD networks, wherein the transmit and receive
 802 frequencies are identical ($f_{21}(k) = f_{12}(k) = f(k)$) and the transmit and
 803 receive time slots are separated by short time intervals ($t_{21}(l) = t_{12}(l) + \Delta_{21}$
 804 $\approx t(l)$), and ~~$\mathbf{H}_{21}(k, l)$ and $\mathbf{H}_{21}(k, l)$~~ . [$\mathbf{H}_{21}(k, l)$ and
 805 $\mathbf{H}_{12}(k, l)$] become substantively reciprocal, such that the subarrays
 806 comprising ~~$\mathbf{H}_{21}(k, l)$ and $\mathbf{H}_{21}(k, l)$~~ . [$\mathbf{H}_{21}(k, l)$ and $\mathbf{H}_{12}(k, l)$
 807] satisfy $\mathbf{H}_{21}(k, l; n_2, n_1) \approx \delta_{21}(k, l; n_1, n_2) \mathbf{H}_{12}^T(k, l$
 808 $; n_1, n_2)$, where $\delta_{21}(k, l; n_1, n_2)$ is a unit-magnitude, generally
 809 nonreciprocal scalar, equalizing the observed timing offsets, carrier offsets, and
 810 phase offsets, such that $\lambda_{21}(n_2, n_1) \approx \lambda_{12}(n_1, n_2)$, $\tau_{21}(n_2, n_1) \approx$
 811 $\tau_{12}(n_{2[1]}, n_{4[2]})$, and $\nu_{21}(n_1, n_2) \approx \nu_{12}(n_{2[1]}, n_{4[2]})$, by
 812 synchronizing each node to an external, universal time and frequency standard,

813 obtaining $\delta_{21}(k, l; n_{4[2]}, n_{2[1]}) \approx 1$, and establishing network channel
814 response as truly reciprocal $\mathbf{H}_{21}(k, l) \approx \mathbf{H}_{21}^T [\mathbf{H}_{12}^T](k, l)$.

815

816

817 52. A method as in claim 51, wherein the synchronization of each node is to Global
818 Position System Universal Time Coordinates (GPS UTC).

819

820

821 53. (original) A method as in claim 51, wherein the synchronization of each node is to a
822 network timing signal.

823

824

825 54. (original) A method as in claim 51, wherein the synchronization of each node is to a
826 combination of Global Position System Universal Time Coordinates (GPS UTC) and a
827 network timing signal.

828

829

830 55. (currently amended) A method as in claim 1, wherein the step of dynamically
831 adapting the diversity channels [capability means] and said proper subsets to optimize
832 said network further comprises:

833 for such parts of the network where the internode channel responses possess
834 substantive multipath, such that $\mathbf{H}_{21}(k, l; n_2, n_1)$ and $\mathbf{H}_{21[12]}(k, l$
835 $; n_{2[1]}, n_{4[2]})$ have rank greater than unity, making the channel response
836 substantively reciprocal by:

837

838 (1) forming uplink and downlink transmit signals using the matrix formula
839 in EQ. 40

$$840 \quad \mathbf{s}_1(k, l; n_1) = \mathbf{G}_1(k, l; n_1) \mathbf{d}_1(k, l; n_1)$$

$$\mathbf{s}_2(k, l; n_1) = \mathbf{G}_2(k, l; n_2) \mathbf{d}_2(k, l; n_2);$$

(2) reconstructing the data intended for each receive node using the matrix formula in EQ. 41

$$\mathbf{y}_1(k, l; n_1) = \mathbf{W}_1^H(k, l; n_1) \mathbf{x}_1(k, l; n_1)$$

$$\mathbf{y}_2(k, l; n_2) = \mathbf{W}_2^H(k, l; n_2) \mathbf{x}_2(k, l; n_2);$$

(3) developing combiner weights that $\{\mathbf{w}_1(k, l; n_2, n_1)\}$ and $\{\mathbf{w}_2(k, l; n_1, n_2)\}$ that substantively null data intended for recipients during the symbol recovery operation, such that for $n_1 \neq n_2$:

(4) developing distribution weights $\{\mathbf{g}_1(k, l; n_2, n_1)\}$ and $\{\mathbf{g}_2(k, l; n_1, n_2)\}$ that perform equivalent substantive nulling operations during transmit signal formation operations;

(5) scaling distribution weights to optimize network capacity and/or power criteria, as appropriate for the specific node topology and application addressed by the network;

(6) removing residual timing and carrier offset remaining after recovery of the intended network data symbols;

and

(7) encoding data onto symbol vectors based on the end-to-end SINR obtainable between each transmit and intended recipient node, and decoding that data after symbol recovery operations, using channel coding and decoding methods develop in prior art.

862

863 56. (currently amended) A method as in claim 1, wherein dynamically adapting the
864 diversity channels [capability means] and said proper subsets to optimize said network
865 further comprises:

866 forming substantively nulling combiner weights using an FFT-based least-squares
867 algorithms that adapt $\{\mathbf{w}_1(k, l; n_2, n_1)\}$ and $\{\mathbf{w}_2(k, l; n_1, n_2)\}$ to
868 values that minimize the mean-square error (MSE) between the combiner output
869 data and a known segment of transmitted pilot data;

870 applying the pilot data to an entire OFDM symbol at the start of an adaptation
871 frame comprising a single OFDM symbol containing pilot data followed by a
872 stream of OFDM symbols containing information data;

873 wherein the pilot data transmitted over the pilot symbol is preferably given by
874 EQ. 44 and EQ. 45,

875
$$p_1(k; n_2, n_1) = d_1(k, 1; n_2, n_1)$$

876
$$= p_{01}(k) p_{21}(k; n_2) p_{11}(k; n_1)$$

877
$$p_2(k; n_1, n_2) = d_2(k, 1; n_1, n_2)$$

878
$$= p_{02}(k) p_{12}(k; n_1) p_{22}(k; n_2)$$

879 such that the “pseudodelays” $\delta_1(n_1)$ and $\delta_2(n_2)$ are unique to each transmit
880 node (in small networks), or provisioned at the beginning of communication with
881 any given recipient node (in which case each will be a function of n_1 and n_2),
882 giving each pilot symbol a pseudorandom component;

maintaining minimum spacing between any pseudodelays used to communicate with a given recipient node that is larger than the maximum expected timing offset observed at that recipient node, said spacing should also being an integer multiple of $1/K$, where K is the number of tones used in a single FFT-based LS algorithm;

and if K is not large enough to provide a sufficiency of pseudodelays, using additional OFDM symbols for transmission of pilot symbols, either lengthening the effective value of K , or reducing the maximum number of originating nodes transmitting pilot symbols over the same OFDM symbol;

also providing K large enough to allow effective combiner weights to be constructed from the pilot symbols alone;

then obtaining the remaining information-bearing symbols, which are the uplink and downlink data symbols provided by prior encoding, encryption, symbol randomization, and channel preemphasis stages, in the adaptation frame, by [using] EQ. 46 and EQ. 47

$$d_1(k, l; n_2, n_1) = p_1(k; n_2, n_1) d_{01}(k, l; n_2, n_1)$$

$$d_2(k, l; n_1, n_2) = p_2(k; n_1, n_2) d_{02}(k, l; n_1, n_2);$$

removing at the recipient node, first the pseudorandom pilot components from the received data by multiplying each tone and symbol by the pseudorandom components of the pilot signals, using EQ. 47 and EQ. 48

$$d_2(k, l; n_1, n_2) = p_2(k; n_1, n_2) d_{02}(k, l; n_1, n_2)$$

$$\mathbf{x}_{02}(k, l; n_2) = c_{01}(k; n_2) \mathbf{x}_2(k, l; n_2);$$

thereby transforming each authorized and intended pilot symbol for the recipient node into a complex sinusoid with a slope proportional to the sum of the pseudodelay used during the pilot generation procedure, and the actual observed timing offset for that link, and leaving other, unauthorized pilot symbols, and symbols intended for other nodes in the network, untransformed and so appearing as random noise at the recipient node.

57. (currently amended) A method as in claim 55, wherein the FFT-Least Squares algorithm is that shown in Figure 37, [further comprises:

using a pilot symbol, which is multiplied by a unit-norm FFT window function;

passing that result to a QR decomposition algorithm and computing orthogonalized data $\{\mathbf{q}(k)\}$ and an upper-triangular Cholesky statistics matrix \mathbf{R} ;

then multiplying each vector element of $\{\mathbf{q}(k)\}$ by the same unit-norm FFT window function and passing it through a zero-padded inverse Fast Fourier Transform (IFFT) with output length PK , with padding factor P to form uninterpolated, spatially whitened processor weights $\{\mathbf{u}(m)\}$, where lag index m is proportional to target pseudodelay $\delta(m) = m/PK$;

then using the spatially whitened processor weights to estimate the mean-square-error (MSE) obtaining for a signal received at each target pseudodelay, $\varepsilon(m) = 1 - \|\mathbf{u}(m)\|^2$, yielding a detection statistic (pseudodelay indicator function), with an extreme at IFFT lags commensurate with the observed pseudodelay and designed to minimize interlag interference between pilot signal features in the pseudodelay indicator function;

using an extremes-finding algorithm to detect each extreme;

estimating the location of the observed pseudodelays to sub-lag accuracy;

determining additional ancillary statistics;

selecting the extremes beyond a designated MSE threshold;
 interpolating spatially whitened weights \mathbf{U} from weights near the extremes;
 using the whitened combiner weights \mathbf{U} to calculate both unwhitened combiner
 weights $\mathbf{W} = \mathbf{R}^{-1}\mathbf{U}$ to be used in subsequent data recovery operations, and to
 estimate the received channel aperture matrix $\mathbf{A} = \mathbf{R}^H\mathbf{U}$, to facilitate ancillary
 signal quality measurements and fast network entry in future adaptation frames;
 and, lastly,
 using an estimated and optimized pseudodelay vector δ_* to generate $\mathbf{c}_1(k) =$
 $\exp\{-j2\pi\delta_*k\}$ (conjugate of $\{p_{11}(k; n_1)\}$ during uplink receive
 operations, and $\{p_{22}(k; n_2)\}$ during downlink receive operations), which is then
 used to remove the residual observed pseudodelay from the information bearing
 symbols.

58. (original) A method as in claim 55, wherein the pseudodelay estimation is refined
 using a Gauss-Newton recursion using the approximation :

$$\exp\{-j2\pi\Delta(k-k_0)/PK\} \approx 1 -j2\pi\Delta(k-k_0)/PK.$$

59. (currently amended) A method as in claim 1, wherein wherein dynamically
 adapting the diversity channels [capability means] and said proper subsets to optimize
 said network further comprises:

using the linear combiner weights provided during receive operations are
 construct linear distribution weights during subsequent transmit operations, by
 setting distribution weight $\mathbf{g}_1(k, l; n_2, n_1)$ proportional to

$\mathbf{w}_1^*(k, l; n_2, n_1)$ during uplink transmit operations, and
 $\mathbf{g}_2(k, l; n_1, n_2)$ proportional to $\mathbf{w}_2^*(k, l; n_1, n_2)$ during downlink
transmit operations; thereby making the transmit weights substantively nulling
and thereby allowing each node to form frequency and time coincident two-way
links to every node in its field of view, with which it is authorized (through
establishment of link set and transfer of network/recipient node information) to
communicate.

60. (original) A method as in claim 1, wherein each node in the first subset of nodes
further comprises:

a LEGO implementation element and algorithm.

61. (currently amended) A method as in claim 1, wherein dynamically adapting the
diversity channels [capability means] and said proper subsets to optimize said network
further comprises:

balancing the power use against capacity for each channel, link, and node, and
hence for the network as a whole by:

establishing a capacity objective $\mathbf{B} [\{ \beta(m) \}]$ for a particular Node-2

[user 2 node] receiving from [a user 1 node] another Node-1 as the target
to be achieved by the [user 2 node] node-2[;]

solving, at [the user 2 node] Node-2 the local optimization problem:

$$\min \sum_q \pi_1(q) = [=] \mathbf{1}^T \boldsymbol{\pi}_1, \text{ such that}$$

$$\sum_{q \in Q(m)} \log(1 + \gamma(q)) \geq \beta(m),$$

where $\pi_1(q)$ is the SU-(user-1-node) transmit power for link

number $q [q]$ for the user 1 node,

$\gamma(q)$ is the signal to interference [and] noise ratio (SINR) seen at the output of the beamformer,

$\mathbf{1}$ is a vector of all 1s,

and,

$\boldsymbol{\pi}_1$ is a vector whose q^{th} element is $\pi_1(q)$ [q^{th} element is $\pi_1(q)$],

the aggregate set $Q(m)$ [$Q(m)$] contains a set of links that are grouped together for the purpose of measuring capacity flows through those links;

using at Node-2 [the user 2 node] the local optimization solution to moderate the transmit and receive weights, and signal information, returned to node-1 [user 1 node];;

and,

using said feedback to compare against the capacity objective B [$\{\beta(m)\}$] and incrementally adjust the transmit power at each of Node

1 [the user 1 node] and Node-2 [the user 2 node] until no further improvement is perceptible.

62. (currently amended) A method as in claim 1, wherein dynamically adapting the diversity channels [capability means] and said proper subsets to optimize said network further comprises:

using the downlink objective function in EQ. 5 and EQ. 6

$$\min \sum_q \pi_2(q) = \mathbf{1}^T \boldsymbol{\pi}_2 \text{ such that } \sum_{q \in Q(m)} \log(1 + \gamma(q)) \geq \beta(m)$$

at each node to perform local optimization;

reporting the required feasibility condition, $\sum_{q \in Q(m)} \pi_1(q) \leq R_1(m)$

1011 $[\sum_{q \in Q(m)} \pi_1(q) \leq R_1(m)];$

1012 and,

1013 modifying $\beta(m)$ as necessary to stay within the constraint.

1014

1015

1016 63. (original) A method as in claim 60[61], wherein:

1017 the capacity constraints $\beta(m)$ are determined in advance for each proper subset
1018 of nodes, based on known QoS requirements for each said proper subset.

1019

1020

1021 64. (currently amended) A method as in claim 60[61], wherein said network further
1022 seeks to minimize total power in the network as suggested by EQ. 4

1023 $\sum_{q \in Q(m)} \log(1 + \gamma(q)) \geq \beta(m).$

1024

1025

1026 65. (currently amended) A method as in claim 60[61], wherein said network sets as
1027 a target objective for the network $\mathbf{B} [\{ \beta(m) \}]$ the QoS for the network.

1028

1029

1030 66. (currently amended) A method as in claim 60[61], wherein said network sets as
1031 a target objective for the network $\mathbf{B} [\{ \beta(m) \}]$ a vector of constraints.

1032

1033

1034 67. (currently amended) A method as in claim 60[61], wherein the local
1035 optimization problem is further defined such that:

1036

the receive and transmit weights are unit normalized with respect to the background interference autocorrelation matrix;

the local SINR is expressed as ~~EQ. 8~~ [

$$\gamma(q) = \frac{P_{rt}(q, q)\pi_t(q)}{1 + \sum_{j \neq q} P_{rt}(q, j)\pi_t(j)}];$$

and the weight normalization in ~~EQ. 6~~ [

$$\sum_{q \in Q(m)} \log(1 + \gamma(q)) \geq \beta(m)]$$

is used to enable [$D_{12}(\mathbf{W}, \mathbf{G}) = D_{21}(\mathbf{G}^*, \mathbf{W}^*)$, where $(\mathbf{W}_2, \mathbf{G}_1)$

and $(\mathbf{W}_1, \mathbf{G}_2)$ represent the receive and transmit weights employed by all nodes in the network during uplink and downlink operations, respectively,] ~~the reciprocity equation~~ at that node, thereby allowing the uplink and downlink function to be presumed identical rather than separately computed.

68. (currently amended) A method as in claim 60[61], wherein:

very weak constraints to the transmit powers are approximated by using a very simple approximation for ~~$\gamma(q)$~~ $[\gamma(q)]$.

69. (currently amended) A method as in claim 60[61], for the cases wherein all the aggregate sets contain a single link and non-negligible environmental noise is present, wherein the transmit powers are computed as Perron vectors from ~~EQ. 10~~, [

$$\begin{aligned}
D_{21} &= \log \left(1 + \frac{1}{\rho(\mathbf{P}_{21}) - 1} \right) \\
&= \log \left(1 + \frac{1}{\rho(\mathbf{P}_{12}^T) - 1} \right) \quad]; \\
&= D_{12}
\end{aligned}$$

and a simple power constraint is imposed upon the transmit powers.

70. (currently amended) A method as in claim 60[69], wherein the optimization is performed in alternating directions and repeated.

71. (currently amended) A method as in claim 60[61], wherein each node presumes the post-beamforming interference energy remains constant for the adjustment interval and so solves EQ. 3 [

$$\min_{\pi_1(q)} \sum_q \pi_1(q) = \mathbf{1}^T \boldsymbol{\pi}_1, \text{ subject to the constraint of}$$

$$\sum_{q \in Q(m)} \log(1 + \gamma(q)) \geq \beta(m) \quad]$$

using classic water filling arguments based on Lagrange multipliers, and then uses a similar equation for the reciprocal element of the link.

72. (currently amended) A method as in claim 60[61], wherein at each node the constrained optimization problem stated in EQ. 13 and 14 [

$$\max_m \sum_{q \in Q(m)} \log(1 + \gamma(q)), \text{ such that}$$

$$\sum_{q \in Q(m)} \pi_1(q) \leq R_1(m), \gamma(q) \geq 0 \quad]$$

1081 is solved using the approximation in EQ. 11, [

$$\gamma(q) = \frac{P_{21}(q, q) \pi_1(q)}{i_2(q)} \quad]$$

1083 and the network further comprises at least one high-level network controller that controls
 1084 the power constraints ~~$R_1(q)$~~ [$R_1(m)$], and drives the network towards a max-min
 1085 solution.

1086

1087

1088 73. (currently amended) A method as in claim 60[61], wherein each node:

1089 is given an initial γ_0 ;

1090 generates the model expressed in EQ. 20, EQ. 21, and EQ. 22;

1091 updates the new γ_α from EQ. 23 and EQ. 24;

1092 determines a target SINR to adapt to;

1093 and,

1094 updates the transmit power for each link q according to ~~EQ. 25 and EQ. 26~~ [

$$\pi_2(q) = \gamma_\alpha i_1(q) / |h(q)|^2$$

$$\pi_1(q) = \gamma_\alpha i_2(q) / |h(q)|^2 \quad].$$

1097

1098

1099 74. (currently amended) A method as in claim 60[61], for each node wherein the
 1100 transmit power relationship of ~~EQ. 25 and EQ. 26~~ [

$$\pi_2(q) = \gamma_\alpha i_1(q) / |h(q)|^2$$

1101

$$\pi_1(q) = \gamma_\alpha i_2(q) / |h(q)|^2 \quad]$$

is not known, that:

uses a suitably long block of N samples is used to establish the relationship, where N is either 4 times the number of antennae or 128, whichever is larger; uses the result to update the receive weights at each end of the link; optimizes the local model as in ~~EQ. 23 and EQ. 24~~ [

$$\gamma_* = \arg \min_{\gamma} L(\gamma, \mathbf{g}, \beta)$$

$$\gamma_\alpha = \gamma_0 + \alpha(\gamma_* - \gamma_0) \quad];$$

and then applies [

$$\pi_2(q) = \gamma_\alpha i_1(q) / |h(q)|^2$$

$$\pi_1(q) = \gamma_\alpha i_2(q) / |h(q)|^2 \quad] \quad \text{EQ. 25 and EQ. 26.}$$

1113

1114

75. (currently amended) A method as in claim 60[61] that, for an aggregate proper subset m :

for each node within the set m , inherits the network objective function model given in ~~EQ. 28, EQ. 29, and EQ. 30~~ [

$$L_m(\gamma, \mathbf{g}, \beta) = \sum_{q \in Q(m)} \mathbf{g}_q \gamma(q)$$

$$\sum_{q \in Q(m)} \log(1 + \gamma(q)) \geq \beta(m)$$

$$g(q) = i_1(q)i_2(q) / |h(q)|^2 \quad];$$

eliminates the [a] step of matrix channel estimation, transmitting instead from that node as a single real number for each link to the other end of said link an estimate of the post beamforming interference power; and ,

1126 receives back for each link a single real number being the transmit power.

1127

1128 76. (original) A method as in claim 75, that for each pair of nodes assigns to the one
1129 presently possessing the most processing capability the power management
1130 computations.

1131

1132

1133 77. (currently amended) A method as in claim 74[75] that estimates the transfer
1134 gains and the post beamforming interference power using simple least squares estimation
1135 techniques.

1136

1137

1138 78. (currently amended) A method as in claim 74[75] that, for estimating the transfer
1139 gains and post beamforming interference power:

1140

1141 instead solves for the transfer gain h using ~~EQ. 31~~

1142 $[y(n) = hgs(n) + \varepsilon(n)]$;

1143 uses a block of N samples of data to estimate h using ~~EQ. 32~~ [

1144
$$h = \frac{\sum_{n=1}^N s^*(n)y(n)}{\sum_{n=1}^N |s(n)|^2 g}]$$

1145 obtains an estimation of residual interference power $R_\varepsilon [R_\varepsilon]$ using ~~EQ. 33~~ [

1146
$$R_\varepsilon = \left\langle |\varepsilon(n)|^2 \right\rangle$$

$$= \frac{1}{N} \sum_{n=1}^N \left(|y(n)|^2 - |ghs(n)|^2 \right)]$$

1147 and,
1148 obtains knowledge of the transmitted data symbols $S(n)$ from using
1149 remodulated symbols at the output of the codec.
1150
1151
1152 79. (currently amended) A method as in claim 77 [78] wherein, instead of obtaining
1153 knowledge of the transmitted data symbols $S(n)$ from using remodulated symbols at the
1154 output of the codec, the node uses the output of a property restoral algorithm used in a
1155 blind beamforming algorithm.
1156
1157
1158 80. (currently amended) A method as in claim 77 [78] wherein, instead of obtaining
1159 knowledge of the transmitted data symbols $S(n)$ from using remodulated symbols at the
1160 output of the codec, the node uses a training sequence explicitly transmitted to train
1161 beamforming weights and asset the power management algorithms.
1162
1163
1164 81. (currently amended) A method as in claim 77 [78] wherein, instead of obtaining
1165 knowledge of the transmitted data symbols $S(n)$ from using remodulated symbols at the
1166 output of the codec, the node uses any combination of:
1167 the output of a property restoral algorithm used in a blind beamforming algorithm;
1168 a training sequence explicitly transmitted to train beamforming weights and asset
1169 the power management algorithms;
1170 or,
1171 other means known to the art.
1172
1173

82. (currently amended) A method as in claim 60[61], wherein each node incorporates a link level optimizer and a decision algorithm, ~~as illustrated in Figure 32A and 32B.~~

83. (currently amended) A method as in claim 81[82], wherein the decision algorithm is a Lagrange multiplier technique.

84. (currently amended) A method as in claim 60[61], wherein the solution to EQ. 3 is implemented by a penalty function technique.

85. (currently amended) A method as in claim 83[84], wherein the penalty function technique:

takes the derivative of $\gamma(q)$ [$\mathcal{N}(q)$] with respect to π_1 ;

and,

uses the Kronecker-Delta function and the weighted background noise.

86. (currently amended) A method as in claim 83[84], wherein the penalty function technique neglects the noise term.

87. (currently amended) A method as in claim 83[84], wherein the penalty function technique normalizes the noise term to one.

88. (currently amended) A method as in claim 60[61], wherein the approximation uses the receive weights.

1205 89. (currently amended) A method as in claim 60[61], wherein adaptation to the
1206 target objective is performed in a series of measured and quantized descent and ascent
1207 steps.

1208

1209 90. (currently amended) A method as in claim 60[61], wherein the adaptation to the
1210 target objective is performed in response to information stating the vector of change.

1211

1212

1213 91. (currently amended) A method as in claim 60[61], which uses the log linear
1214 mode in ~~EQ. 34~~ [

1215
$$\beta_q \approx \log \left(\frac{a \pi_1(q) + a_0}{b \pi_1(q) + b_0} \right) = \hat{\beta}_q(\pi_1(q))]$$

1216 and the inequality characterization in ~~EQ. 35~~ [$\hat{\beta}_q(\pi_1(q)) \geq \beta$] to solve the
1217 approximation problem with a simple low dimensional linear program.

1218

1219

1220 92. (currently amended) A method as in claim 60[61], develops the local mode by
1221 matching function values and gradients between the current model and the actual
1222 function.

1223

1224

1225 93. (currently amended) A method as in claim 60[61], which develops the model as
1226 a solution to the least squares fit, evaluated over several points.

1227

1228

1229 94. (currently amended) A method as in claim 60[61], which reduces the cross-
1230 coupling effect by allowing only a subset of links to update at any one particular time,
1231 wherein the subset members are chosen as those which are more likely to be isolated
1232 from one another.

1233

1234

1235

1236 95. (currently amended) A method as in claim 60[61], wherein:

1237 the network further comprises a network controller element;

1238 said network controller element governs a subset of the network;

1239 said network controller element initiates, monitors, and changes the target

1240 objective for that subset;

1241 said network controller communicates the target objective to each node in that

1242 subset;

1243 and,

1244 receives information from each node concerning the adaptation necessary to meet

1245 said target objective.

1246

1247

1248 96. (currently amended) A method as in claim 94[95], wherein said network further

1249 records the scalar and history of the increments and decrements ordered by the network

1250 controller.

1251

1252

1253 97. (currently amended) A method as in claim 60[61], wherein for any subset, a

1254 target objective may be a power constraint.

1255

1256

1257 98. (currently amended) A method as in claim 60[61], wherein for any subset, a

1258 target objective may be a capacity maximization subject to a power constraint.

1259

1260

1261 99. (currently amended) A method as in claim 60[61], wherein for any subset, a

1262 target objective may be a power minimization subject to the capacity attainment to the

1263 limit possible over the entire network.

1264
1265
1266 100. (currently amended) A method as in claim 60[61], wherein for any subset, a
1267 target objective may be a power minimization at each particular node in the network
1268 subject to the capacity constraint at that particular node.
1269
1270
1271 101. (currently amended) A wireless electromagnetic communications network,
1272 comprising:
1273 a wireless electromagnetic communications network, comprising
1274 a set of nodes, said set further comprising,
1275 at least a first subset wherein each node is MIMO-capable,
1276 comprising:
1277 a spatially diverse antennae array of M antennae, where M
1278 \geq one,
1279 a transceiver for each antenna in said array,
1280 means for digital signal processing,
1281 means for coding and decoding data and symbols,
1282 means for diversity transmission and reception,
1283 and,
1284 means for input and output from and to a non-radio
1285 interface;
1286 said set of nodes further comprising one or more proper subsets of nodes,
1287 being at least one transmitting and at least one receiving subset, with said
1288 transmitting and receiving subsets having a topological arrangement
1289 whereby:
1290 each node in a transmitting subset has no more nodes with which it
1291 will simultaneously communicate in its field of view, than it has
1292 number of antennae;

1293 each node in a receiving subset has no more nodes with which it
 1294 will simultaneously communicate in its field of view, than it can
 1295 steer independent nulls to;
 1296 and,
 1297 each member of a non-proper subset cannot communicate with any
 1298 other member of its non-proper subset;
 1299 transmitting independent information from each node in a first non-proper subset
 1300 to one or more receiving nodes belonging to a second non-proper subset that are
 1301 viewable from the transmitting node;
 1302 processing independently information transmitted to a receiving node in a second
 1303 non-proper subset from one or more nodes in a first non-proper subset is
 1304 independently by the receiving node;
 1305 and,
 1306 optimizing the network by dynamically adapting the ~~diversity channels~~ [means for
 1307 diversity transmission and reception] between nodes of said transmitting and receiving
 1308 subsets.
 1309
 1310
 1311 102. (currently amended) An apparatus as in claim ~~100~~—[101], further
 1312 comprising an element for scheduling according to a Demand-Assigned, Multiple-Access
 1313 algorithm.
 1314
 1315
 1316 103. (currently amended) An apparatus as in claim ~~100~~—[101], further comprising for
 1317 each node in said first subset a LEGO adaptation element.
 1318
 1319
 1320 104. (currently amended) An apparatus as in claim ~~100~~—[101], further comprising:
 1321 for each node in said first subset a LEGO adaptation element; and,
 1322 one or more network controllers.
 1323

1324

1325 105. (currently amended) A method as in claim 1, wherein the step of dynamically
1326 adapting the diversity channels [capability means] and said proper subsets to optimize
1327 said network further comprises:

1328

1329 matching each transceiver's degrees of freedom (DOF) to the nodes in the
1330 possible link directions;

1331 equalizing those links to provide node-equivalent uplink and downlink capacity.

1332

1333 106. (original) A method as in claim 105, further comprising, after the DOF matching:

1334 assigning asymmetric transceivers to reflect desired capacity weighting;

1335 adapting the receive weights to form a solution for multipath resolutions;

1336 employing data and interference whitening as appropriate to the local conditions;

1337 and,

1338 using retrodirective transmission gains during subsequent transmission operations.

1339

1340

1341 107. (original) A method as in claim 105, wherein the receive weights are ~~similarly-~~
1342 ~~modified~~ [matched to the nodes in the possible link directions].

1343

1344

1345 108. (currently amended) A method for optimizing a wireless electromagnetic
1346 communications network, comprising:

1347 a wireless electromagnetic communications network, comprising

1348 a set of nodes, said set of nodes further comprising,

1349 at least a first subset wherein each node is MIMO-capable,

1350 comprising:

1351 an antennae array of M [M] antennae, where M [M] \geq one,

1352 a transceiver for each antenna in said spatially diverse

1353 antennae array,

1354 means for digital signal processing to convert analog radio
1355 signals into digital signals and digital signals into analog
1356 radio signals,
1357 means for coding and decoding data, symbols, and control
1358 information into and from digital signals,
1359 diversity capability means for transmission and reception of
1360 said analog radio waves [signals];
1361 and,
1362 means for input and output from and to a non-radio
1363 interface for digital signals;
1364 said set of nodes being deployed according to design rules that prefer
1365 meeting the following criteria:
1366
1367 said set of nodes further comprising two or more proper subsets of
1368 nodes, with a first proper subset being the transmit uplink / receive
1369 downlink set, and a second proper subset being the transmit
1370 downlink / receive uplink set;
1371
1372 each node in said set of nodes belonging to no more transmitting
1373 uplink or receiving uplink subsets than it has diversity capability
1374 means;
1375
1376 each node in a transmit uplink / receive downlink subset has no
1377 more nodes with which it will hold time and frequency coincident
1378 communications in its field of view, than it has diversity capability
1379 [means];
1380
1381 each node in a transmit downlink / receive uplink subset has no
1382 more nodes with which it will hold time and frequency coincident
1383 communications in its field of view, than it has diversity capability
1384 [means];

1385
 1386 each member of a transmit uplink / receive downlink subset cannot
 1387 hold time and frequency coincident communications with any
 1388 other member of that transmit uplink / receive downlink subset;
 1389 and,
 1390 each member of a transmit downlink / receive uplink subset cannot
 1391 hold time and frequency coincident communications with any
 1392 other member of that transmit downlink / receive uplink subset;
 1393
 1394 transmitting, in said wireless electromagnetic communications network,
 1395 independent information from each node belonging to a first proper subset, to one
 1396 or more receiving nodes belonging to a second proper subset that are viewable
 1397 from the transmitting node;
 1398
 1399 processing independently, in said wireless electromagnetic communications
 1400 network, at each receiving node belonging to said second proper subset,
 1401 information transmitted from one or more nodes belonging to said first proper
 1402 subset;
 1403
 1404 optimizing at the local level for each node for the channel capacity $\mathbb{D} [D]_{21}$
 1405 according to EQ. 49, [

$D_{21} = \max \beta$ such that

$$\beta \leq \sum_{q \in U(m)} \sum_k \log(1 + \gamma(k, q)),$$

$$\gamma(k, q) \geq 0,$$

1406

$$\sum_m R_1(m) \leq R, \quad];$$

$$\pi_1(k, q) \geq 0,$$

$$\sum_{q \in U(m)} \sum_k \pi_1(k, q) \leq R_1(m)$$

1407

solving first the reverse link power control problem; then treating the forward link

1408

problem in an identical fashion, substituting the subscripts 2 for 1 in said

1409

equation;

1410

and,

1411

dynamically adapting the diversity channels [capability means] and said proper

1412

subsets to optimize said network.

1413

1414

1415 109. (currently amended) A method as in claim 108, further comprising:

1416

1417 for each aggregate subset m , attempting to achieve the given capacity objective, β

1418

[β], as described in [

1419

[$\min_{\pi_r(q)} \sum_{q \in Q(m)} \pi_r(q)$], such that

1420

$$\beta = \sum_{q \in Q(m)} \log(1 + \gamma(q))$$

1421

]

1422

EQ. 50, by:

(1) optimizing the receive beamformers, using simple MMSE processing, to simultaneously optimize the SINR;

(2) based on the individual measured SINR for each q [q] index, attempt to incrementally increase or lower its capacity as needed to match the current target; and,

(3) step[p]ing the power by a quantized small step in the appropriate direction; then,

when all aggregate sets have achieved the current target capacity, then the network can either increase the target capacity β , or add additional users to exploit the now-known excess capacity.

110. (currently amended) A method as in claim 106[107], wherein ~~instead of optimizing for channel [capability means] capacity~~, the network optimizes for QoS [and not diversity capability means capacity].

111. (currently amended) A method as in claim 94[95], wherein:

said network controller adds, drops, or changes the target capacity for any node in the set the network controller controls.

112. (currently amended) A method as in claim 94[95], wherein:

said network controller may, either in addition to or in replacement for altering β , add, drop, or change channels between nodes, frequencies, coding, security, or protocols, polarizations, or traffic density allocations usable by a particular node or channel.

113. (currently amended) A wireless electromagnetic communications network, comprising:

a set of nodes, said set further comprising,
 at least a first subset wherein each node is MIMO-capable,
 comprising:
 a spatially diverse antennae array of $M[M]$ antennae, where
 $M[M] \geq \text{one}$,
 a transceiver for each antenna in said array,
~~13~~ means for digital signal processing,
~~14~~ means for coding and decoding data and symbols,
~~19~~ means for diversity transmission and reception,
 pilot symbol coding & decoding element
 timing synchronization element
 and,
 means for input and output from and to a non-radio
 interface;
 said set of nodes further comprising two or more proper subsets of nodes,
 there being at least one transmitting and at least one receiving subset, with
 said transmitting and receiving subsets subset having a diversity
 arrangement whereby:
 each node in a transmitting subset has no more nodes with which it
 will simultaneously communicate in its field of view, than it has
 number of antennae;
 each node in a receiving subset has no more nodes with which it
 will simultaneously communicate in its field of view, than it can
 steer independent nulls to;
 and,
 each member of a non-proper subset cannot communicate with any
 other member of its non-proper subset over identical diversity
 channels;
 a LEGO adaptation element and algorithm;
 a network controller element and algorithm;

whereby each node in a first non-proper subset transmits independent information to one or more receiving nodes belonging to a second non-proper subset that are viewable from the transmitting node;
each receiving node in said second non-proper subset processes independently information transmitted to a from one or more nodes in a first non-proper subset is independently by the receiving node;
each node uses means to minimize SINR between nodes transmitting and receiving information;
the network is designed such that substantially reciprocal symmetry exists for the uplink and downlink channels by,

if the received interference is spatially white in both link directions, setting

$$\mathbf{g}_1(q) \propto \mathbf{w}_2^*(q) \text{ and } \mathbf{g}_2(q) \propto \mathbf{w}_1^*(q)$$

$$[\mathbf{g}_2(q) \propto \mathbf{w}_2^*(q) \text{ and } \mathbf{g}_1(q) \propto \mathbf{w}_1^*(q)] \text{ at both ends of the link,}$$

where $\{\mathbf{g}_2(q), \mathbf{w}_1(q)\}$ and $\{\mathbf{g}_1(q), \mathbf{w}_2(q)\}$ are the linear transmit and receive weights used in the downlink;

but if the received interference is not spatially white in both link directions, constraining $\{\mathbf{g}_1(q)\}$ and $\{\mathbf{g}_2(q)\}$

$[\{\mathbf{g}_1(q)\} \text{ and } \{\mathbf{g}_2(q)\}]$ to satisfy:

$$Q_{21}$$

$$\sum_{q=1}^{Q_{21}} \mathbf{g}_1^T(q) \mathbf{R}_{i+11} [\mathbf{n}_1(q)] \mathbf{g}_1^*(q) =$$

$$q=1$$

$$N_1$$

$$\sum_{n=1}^N \text{Tr}\{\mathbf{R}_{i+11}(n)\} = M_1 \mathbf{R}_{11};$$

$$n=1$$

1509

 Q_{i2}

1510

$$\sum_{q=1}^{Q_{i2}} \mathbf{g}_2^T(q) \mathbf{R}_{i2i2} [n_2(q)] \mathbf{g}_2^*(q) =$$

1511

$$\sum_{n=1}^{N_2} \text{Tr}\{\mathbf{R}_{i2i2}(n)\} = M_2 R_2,$$

1512

 $n=1$

1513

$$\sum_{n=1}^{N_2} \text{Tr}\{\mathbf{R}_{i2i2}(n)\} = M_2 R_2,$$

1514

 N_2 [

1515

1516

$$\sum_{q=1}^{Q_{21}} \mathbf{g}_1^T(q) \mathbf{R}_{i_1 i_1} (n_1(q)) \mathbf{g}_1^*(q) = \sum_{n=1}^{N_1} \text{Tr}\{\mathbf{R}_{i_1 i_1}(n)\} = M_1 R_1$$

1517

$$\sum_{q=1}^{Q_{12}} \mathbf{g}_2^T(q) \mathbf{R}_{i_2 i_2} (n_2(q)) \mathbf{g}_2^*(q) = \sum_{n=1}^{N_2} \text{Tr}\{\mathbf{R}_{i_2 i_2}(n)\} = M_2 R_2$$

1518

];

1519

the network uses any standard communications protocol;

1520

and,

1521

the network is optimized by dynamically adapting the [means for diversity

1522

transmission and reception] diversity channels between nodes of said transmitting

1523

and receiving subsets.

1524

1525

1526

114. (currently amended) A wireless electromagnetic communications network as in

1527

claim 112[113]:

1528

wherein each node may further comprise a Butler Mode Forming element, to

1529

enable said node to ratchet the number of active antennae for a particular uplink

1530

or downlink operation up or down.

1531

1532

1533 115. (currently amended) A wireless electromagnetic communications network as in
1534 claim 50[101]:
1535 incorporating a dynamics-resistant multitone element.
1536
1537
1538 116. (original) The use of a method as described in claim 1 for fixed wireless
1539 electromagnetic communications.
1540
1541 117. (currently amended) The use of an apparatus as described in claim 50[101]for
1542 fixed wireless electromagnetic communications.
1543
1544 118. (original) The use of a method as described in claim 1 for mobile wireless
1545 electromagnetic communications.
1546
1547 119. (currently amended) The use of an apparatus as described in claim 50[101]for
1548 mobile wireless electromagnetic communications.
1549
1550 120. (original) The use of a method as described in claim 1 for mapping operations using
1551 wireless electromagnetic communications.
1552
1553 121. (currently amended) The use of an apparatus as described in claim 50[101]for
1554 mapping operations using wireless electromagnetic communications.
1555
1556 122. (original) The use of a method as described in claim 1 for a military wireless
1557 electromagnetic communications network.
1558
1559 123. (currently amended) The use of an apparatus as described in claim 50[101]for a
1560 military wireless electromagnetic communications network.
1561
1562 124. (original) The use of a method as described in claim 1 for a military wireless
1563 electromagnetic communications network for battlefield operations.

1564

1565 125. (currently amended) The use of an apparatus as described in claim 50[101]for a
1566 military wireless electromagnetic communications network for battlefield operations.

1567

1568 126. (original) The use of a method as described in claim 1 for a military wireless
1569 electromagnetic communications network for Back Edge of Battle Area (BEBA)
1570 operations.

1571

1572 127. (original) The use of an apparatus as described in claim 50[101]for a military
1573 wireless electromagnetic communications network for Back Edge of Battle Area (BEBA)
1574 operations..

1575

1576 128. (original) The use of a method as described in claim 1 for a wireless electromagnetic
1577 communications network for intruder detection operations.

1578

1579 129. (original) The use of an apparatus as described in claim 50[101]for a wireless
1580 electromagnetic communications network for intruder detection operations.

1581

1582 130. (original) The use of a method as described in claim 1 for a wireless electromagnetic
1583 communications network for logistical intercommunications.

1584

1585 131. (original) The use of an apparatus as described in claim 50[101]for a wireless
1586 electromagnetic communications network for logistical intercommunications.

1587

1588 132. (original) The use of a method as described in claim 1 in a wireless electromagnetic
1589 communications network for self-filtering spoofing signals.

1590

1591 133. (original) The use of an apparatus as described in claim 50[101]for a wireless
1592 electromagnetic communications network for self-filtering spoofing signals.

1593

1594 134. (original) The use of a method as described in claim 1 in a wireless
1595 electromagnetic communications network for airborne relay over the horizon.
1596

1597 135. (original) The use of an apparatus as described in claim 50[101]for a wireless
1598 electromagnetic communications network for airborne relay over the horizon.
1599

1600 136. (original) The use of a method as described in claim 1 in a wireless electromagnetic
1601 communications network for traffic control.
1602

1603 137. (currently amended) The use of a method as in claim ~~466~~[1], further comprising
1604 the use thereof for air traffic control.
1605

1606 138. (currently amended) The use of a method as in claim ~~466~~[1], further comprising
1607 the use thereof for ground traffic control.
1608

1609 139. (currently amended) The use of a method as in claim ~~466~~[1], further comprising
1610 the use thereof for a mixture of ground and air traffic control.
1611

1612 140. (original) The use of an apparatus as described in claim 50[101]for a wireless
1613 electromagnetic communications network for traffic control.
1614

1615 141. (currently amended) The use of an apparatus as in claim ~~470~~[101], further
1616 comprising the use thereof for air traffic control
1617

1618 142. (currently amended) The use of an apparatus as in claim ~~470~~[101], further
1619 comprising the use thereof for ground traffic control.
1620

1621 143. (currently amended) The use of an apparatus as in claim ~~470~~[101], further
1622 comprising the use thereof for a mixture of ground and air traffic control.
1623

1624 144. (original) The use of a method as in claim 1 in a wireless electromagnetic
1625 communications network for emergency services.
1626

1627 145. (original) The use of an apparatus as in claim 50[101]in a wireless electromagnetic
1628 communications network for emergency services.
1629

1630 146. (original) The use of a method as in claim 1 in a wireless electromagnetic
1631 communications network for shared emergency communications without interference.
1632

1633 147. (currently amended) The use of an apparatus as in claim 50[101]in a wireless
1634 electromagnetic communications network for shared emergency communications without
1635 interference.
1636

1637 148. (original) The use of a method as in claim 1 in a wireless electromagnetic
1638 communications network for positioning operations without interference.
1639

1640 149. (currently amended) The use of an apparatus as in claim 50[101]in a wireless
1641 electromagnetic communications network for positioning operations without interference.
1642

1643 150. (original) The use of a method as in claim 1 in a wireless electromagnetic
1644 communications network for high reliabilty networks requiring graceful degradation
1645 despite environmental conditions or changes..
1646

1647 151. (currently amended) The use of an apparatus as in claim 50[101]in a wireless
1648 electromagnetic communications network for high reliabilty networks requiring graceful
1649 degradation despite environmental conditions or changes..
1650

1651 152. (original) The use of a method as in claim 1 in a wireless electromagnetic
1652 communications network for a secure network requiring assurance against unauthorized
1653 intrusion.
1654

1655 153. (original) The use of a method as in claim 1 in a wireless electromagnetic
1656 communications network for a secure network requiring message end-point assurance.
1657

1658 154. (original) The use of a method as in claim 1 in a wireless electromagnetic
1659 communications network for a secure network requiring assurance against unauthorized
1660 intrusion and message end-point assurance.
1661

1662 155. (currently amended) The use of an apparatus as in claim 50[101] in a wireless
1663 electromagnetic communications network for a secure network requiring assurance
1664 against unauthorized intrusion.
1665

1666 156. (currently amended) The use of an apparatus as in claim 50[101] in a wireless
1667 electromagnetic communications network for a secure network requiring message end-
1668 point assurance.
1669

1670 157. (currently amended) The use of an apparatus as in claim 50[101] in a wireless
1671 electromagnetic communications network for a secure network requiring assurance
1672 against unauthorized intrusion and message end-point assurance.
1673
1674

1675 158. (original) The use of a method as in claim 1 in a cellular mobile radio service.
1676

1677 159. (currently amended) The use of an apparatus as in claim 50[101] in a cellular
1678 mobile radio service.
1679

1680 160. (original) The use of a method as in claim 1 in a personal communication service.
1681

1682 161. (currently amended) The use of an apparatus as in claim 50[101] in a personal
1683 communication service.
1684

1685 162. (original) The use of a method as in claim 1 in a private mobile radio service.

1686

1687 163. (currently amended) The use of an apparatus as in claim 50[101] in a private
1688 mobile radio service.

1689

1690 164. (original) The use of a method as in claim 1 in a wireless LAN.

1691

1692 165. (currently amended) The use of an apparatus as in claim 50[101] in a wireless LAN.

1693

1694 166. (original) The use of a method as in claim 1 in a fixed wireless access service.

1695

1696 167. (currently amended) The use of an apparatus as in claim 50[101] in a fixed wireless
1697 access service.

1698

1699 168. (original) The use of a method as in claim 1 in a broadband wireless access service.

1700

1701 169. (currently amended) The use of an apparatus as in claim 50[101] in a broadband
1702 wireless access service.

1703

1704 170. (original) The use of a method as in claim 1 in a municipal area network.

1705

1706 171. (currently amended) The use of an apparatus as in claim 50[101] in a municipal area
1707 network.

1708

1709 172. (original) The use of a method as in claim 1 in a wide area network.

1710

1711 173. (currently amended) The use of an apparatus as in claim 50[101] in a wide area
1712 network.

1713

1714 174. (original) The use of a method as in claim 1 in wireless backhaul.

1715

1716 175. (currently amended) The use of an apparatus as in claim 50[101]in wireless
1717 backhaul.
1718
1719 176. (original) The use of a method as in claim 1 in wireless backhaul.
1720
1721 177. (currently amended) The use of an apparatus as in claim 50[101]in wireless
1722 backhaul.
1723
1724 178. (original) The use of a method as in claim 1 in wireless SONET.
1725
1726 179. (currently amended) The use of an apparatus as in claim 50[101]in wireless SONET.
1727
1728 180-181. (Cancelled)
1729
1730 182. (original) The use of a method as in claim 1 in wireless Telematics.
1731
1732 183. (currently amended) The use of an apparatus as in claim 50[101]in wireless
1733 Telematics.
1734
